

Cushion Tire Forklift Attachments

Cushion Tire Forklift Attachment - Cushion tires are a firm tire with a smooth profile. Its' tread is attached to a steel ring in order to shape the tire, and the tire is pressed onto a hub that is attached to the lift truck. These kinds of tires are perfect to use in smooth floor warehouses and are obtainable in different polyurethane or rubber compounds.

A poly tire comprises polyurethane instead of rubber and is also a solid tire. They are utilized rather than cushion tires for such applications which require a higher tire load capacity or a lower steering effort than can be acquired utilizing the cushion tire. Poly tires are in several hardness ratings to be able to meet various particular application requirements. Narrow Aisle models and Orderpicker lift trucks will usually utilize small diameter poly tires for their outrigger load wheels.
